

## Sophisticated, innovative, and unique

**Aquapres** by Lang Dental — While visiting the exhibits at this year's

Aquapres™ by Lang Dental

Hinman Dental Meeting, I was talking to Dave Lang, the owner of Lang Dental Company. He asked me if I had a Lang Aquapres,™ and I said that I thought every dentist had one. He said, "No they don't." I could not believe it because I have used one for years. I asked Dave if he had raised the price. He said he had not, and that the Aquapres™ is still very inexpensive. I said maybe the problem is that it never wears out. Just in case you are one of those who do not know

about the Lang Aquapres™, it will make anything you do with acrylic resins — such as provisionals or removables — better. One of the easiest and most trouble-free methods to obtaining stronger, denser, and porosity-free acrylic work is to use the Lang Aquapres<sup>™</sup> hydraulic pressure curing unit. It works on relines, repairing acrylic on partials. Aquapres<sup>™</sup> is safe to use because it requires no compressed air or electricity. It operates safely under hydraulic pressure, and is easily applied with a twist of the wrist. The complete fabrication system consistently generates dependable, high-quality results by eliminating porosity in methacrylate acrylics while achieving long-lasting color. Equally appealing is the low cost of this unit. Small and compact, Aquapres<sup>™</sup> can also easily be stored in your lab. It is portable, not only within your office, but also to remote clinics such as nursing homes. High quality, dependable, and color-stable, acrylic work is easily, conveniently, and quickly accomplished in your office, your office lab, or chairside. Aquapres<sup>™</sup> is a problem solver that every practice will find helpful. Don't be left out in the cold without the Lang Aquapres<sup>™</sup>. Order one via any dental dealer, or visit www.langdentalmanufacturing.com for more information. **DE** 

**Great Results, Easily Achieved** Creates a stronger, denser acrylic, without

bubbles or porosity for color stable results and increased performance efficiency. Plus easy to teach dental team staff to operate while other important clinical or laboratory tasks need to be addressed

Hydraulic, not pneumatic

Provides a safer work environment over air pressure, without the need for an air compressor, heat or electricity

Compact design

Requires no extra attachments, space saving on a counter or in storage
